

## Cyclone Separator Test Rig

The protection of production equipment by the use of clean input fluids is a vital part of any successful trouble free process. AHTT supplies not only heat transfer equipment but the means to protect that equipment. To validate the suitability of a Bernoulli Separator for a particular application there is now a low cost validation test rig available. Separation of most fouling products with a specific gravity of 1.1 or higher can be tested on site or in-house at AHTT's Sydney facility.

For an evaluation of your product you can either contact AHTT and we will be happy to discuss your situation or simply send in the completed form
